Electric Handbrake

The Electric Handbrake from Des Gosling Mobility converts a regular 'pull to apply' handbrake to a 'push button' system. Perfect for anyone who struggles to apply or release the handbrake, the system quickly applies and releases the handbrake when you need it.

SELF-ADJUSTS FOR LASTING RELIABILITY

Handbrake cables stretch naturally over time, normally accommodated for by pulling the lever up further. The design of our electric handbrake system accounts for this stretch by itself, auto-adjusting to ensure continued full application of the handbrake.

VISUAL AND AUDIO CONFIRMATION

The dashboard light that displays when the handbrake is applied will still function with the electric handbrake fitted. In addition, the system contains a small buzzer which sounds during application or release so you always know when the process is complete.

NEVER GET CAUGHT WITH A FLAT BATTERY

The design of our electronics means that there is no background current drain on your battery from the electric handbrake. Not using the car for a while? No problem, the battery will still be charged and ready to go when you come back to it.

FAST APPLICATION

SIMPLE SWITCH OPERATION

COMPLIANT WITH ROAD VEHICLE CONSTRUCTION & USE REGULATIONS
